Food Safety During COVID-19

Takeout vs. Delivery. Is there a difference in risk?

The risk is the same if the appropriate contamination prevention and controls are followed:

- Maintain social distance.
- Use hand sanitizer with minimum 60% ethanol or 70% isopropanol when soap and water are not available.
- Do not touch your face without washing your hands first.
- Wash your hands for 20 seconds with soap and water after contact with people or takeout/delivery containers.
